

Project Planning Phase

Project Milestone and Activity

Team ID	PNT2022TMID52795
Project Name	University Admit Eligibility Predictor

Empathize

It is the stage at which our team sought to understand prospective user base through a series of activities surrounding researching and analyzing their habits and expectations to begin to understand their wants, needs, and challenges.

Define

The 'define' stage goes hand-in-hand with the previous one. At this stage, our combined and evaluated all of their research and use it to attempt to observe specific challenges users might face – it forced to examine the problem from a more human-centric perspective.

Ideation

Ideation involved gathering together the entire team to examine different viewpoints and opinions on the user goals, frustrations, and challenges identified in the define stage to inform the direction of the actual design.

Prototype

Prototyping is about taking some of the best ideas generated in the ideation phase and turning them into something real and tangible.

Test

Testing is difficult to really attribute to its own separate phase because it ties in so heavily with the previous phase — testing is an essential element of prototyping because it can and should inform the next step in an iterative prototyping process.

Deployment

The deployment phase is the final phase of the software development life cycle and puts the product into production.
